Grapples for Forklifts

Forklift Grapple - Grapples work in conjunction with the crowning operation of the bucket cylinder located on the excavator. They could mount directly onto the jib or whatever quick hitch that is in bucket position. Grapples are normally used for the processing and handling of timber, construction materials, domestic and aggregate waste items. The grapple's boxed design has additional support bridging. This manufactured design offers the grapple with maximum support and strength by way of preventing the body from breaking and rotating during its operation.

The grapple along with all of its moving parts are constructed of hardened steel. The pivot points are designed to be able to ensure holding ability and supreme closing force. The operator has the capacity to handle different sizes and varieties of materials utilizing the jaws built-in at the end part of the grapple with toes. This could enable the jaws to close through one another in a finger configuration for utmost handling capacity.
