

Truss Jib

Truss Jib - A truss jib is used to be able to pick up and place trusses. It is actually an extended jib additional part which is outfitted along with a pyramid or triangular shaped frame. Usually, truss jibs are mounted on equipment like for instance a skid steer loader, a compact telehandler or even a forklift utilizing a quick-coupler attachment.

Older style cranes which have deep triangular truss jibs are most often assemble and fastened using bolts and rivets into standard open structural shapes. There are rarely any welds on these kind jibs. Every bolted or riveted joint is susceptible to rust and thus requires regular upkeep and check up.

Truss jibs are designed with a back-to-back arrangement of lacing members separated by the width of the flange thickness of another structural member. This design can cause narrow separation among the flat surfaces of the lacings. There is little room and limited access to clean and preserve them against corrosion. A lot of rivets loosen and rust within their bores and must be changed.
